Advice for Parents on Influenza A (H1N1)

When should I suspect my child has Influenza A (H1N1)?
The symptoms of Influenza A (H1N1) in children include fever with respiratory symptoms like mild nasal congestion and cough. Older children may complain of headache, sore throat, and muscle aches. This is called “Influenza Like Illness” (ILI).

What should parents do if their child has flu-like symptoms?
The action to take/response will depend on the condition of your child, see table below:

<table>
<thead>
<tr>
<th>Condition of Child</th>
<th>Action to take</th>
<th>Home quarantine with danger signs advice</th>
<th>Admission</th>
<th>Throat swab for H1N1</th>
<th>Medication with Tamiflu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your child has mild influenza symptoms</td>
<td>Stay at home and watch for danger signs (see below)</td>
<td>✓</td>

</tr>
</tbody>
</table>

Danger Signs (to come to the Casualty/A&E if your child has these signs):
1. Lethargy, drowsy, irritability or change in behaviour (less active than usual)
2. Not drinking well, persistent vomiting, not urinating as much as usual
3. Trouble breathing or fast breathing
4. Fits
5. Bluish or gray skin color
6. Persistent fever > 3 days

Parents are advised to separate children who are ill from those who are well at home (not to sleep in the same room). One parent should sleep with sick child and the other children stay in another room. This is to reduce viral load to the other children.
